II.2.4) Description of the procurement

Evidence for Offshore Wind; Potential changes in seabird foraging range and distribution in response to Highly Pathogenic Avian Influenza (HPAI)", will use tagging data collected by the contractor and existing data collected by others to examine the potential effects of changes in colony size on foraging behaviour and ranges to improve evidence for offshore wind environmental assessments. Data will be collected across as much of the breeding season as is feasible i.e., incubation and chick rearing periods. Data analysis will focus on obtaining information on foraging distributions, ranges, and behaviour and the use of the marine environment. Data on seabird flight heights will also be extracted, analysed, and presented. The project will investigate the relationship between foraging ranges, colony size and prey availability and (where data allow) consider how these may have changed since the HPAI outbreak. Particular attention must be paid to assessing how the results of this study should be reflected in the apportioning approaches used in environmental impact assessments, and any changes to the existing models or parameters used for apportioning. The focus of the project will be the east coast of Scotland, but consideration should be given to other regions of Scotland for inclusion.
