**II.1.4) Short description**

London Stadium intends procuring the supply and install of photovoltaic materials on it's c.24,000 sqm roof. This high-profile building offers a fantastic opportunity to showcase cutting edge technology. The key driver for the project is to significantly reduce carbon emissions, in line with a commitment to reach 'net zero' carbon position by 2030. Energy would mostly be used to meet stadium day-to-day needs, but storage or export of energy will be considered. Companies should note that there will be limitations on the weight of the photovoltaic material due to allowable roof loading (e.g. a lightweight material may offer a more viable solution). Installation would be expected to take place during 2023.
