Scope

Reference

Project 1615

Description

A male intraurethral catheter with a magnet controlled valve: A device that primarily consists of an internal urethral catheter with an incorporated magnetically-controlled valve designed to manage urinary continence. The catheter is fully inserted into the urethra/bladder thus having no external tubing. Urine flow is controlled by use of an external magnet used intermittently to open/close the catheter and enable voiding of urine on demand. It is intended to be managed by the patient/layperson at home. This is a single-patient device intended to be left in situ short-term (up to 30 days) before being discarded [single-use] and replaced.

Magnet Control Device: A non-powered, non-invasive, external magnetic device designed to open/close the magnetically-controlled valve of an in situ male intraurethral catheter.

Establishes a framework

Framework

Maximum percentage fee charged to suppliers

0%

Contracting authorities that may use the framework

The Framework will be between the Authority and individual Supplier(s). NHS Supply Chain seeks to establish a framework agreement under which it will be entitled to purchase supplies and/or services which it will make available for purchase by 1) any NHS Trust; 2) any other NHS entity; 3) any government department, agency or other statutory body and/or 4) any private sector entity active in the UK healthcare sector. Only NHS Supply Chain can order from the Framework Agreement and enter into contracts under it.
