

# Comberton Jubilee Wood and Recreation Ground

## Environmental Management Regime

### Update April 2019

The wood is now well established with good growth in the southern half. The paths are clearly delineated and subject to regular mowing.

The ash seedlings forming thick regrowth in the southern part of the wood are affected by ash dieback and will be monitored for survivors annually to ascertain response to disease pressure.

Date	Action	
April	Start <b>monthly</b> cutting of paths	
May	Inspect trees and take appropriate remedial action	
September	Cut 1 m shoulder margin on one side of paths. Last regular cut of pathways. Cut both sides of East-West hedge between the old and new recreation grounds.	
January	Trim rim of hedges to control but maintain berry potential
